

## SantosHuman Inc. Celebrates its 7<sup>th</sup> Anniversary

Founded on July 28th, 2008, SantosHuman Inc. celebrates its 7th anniversary today.

SantosHuman's clients include the most recognizable brands in the world and we continue to build our portfolio of Fortune 500 industry clients and partners. Our ability to deliver new, custom capabilities that compliment coordinated, ongoing R&D in DHM&S for our clients and partners requires that we continue to develop and maintain close-knit teams of experts in DHM&S as well as our strong relationship with the University of Iowa.

SantosHuman is proving the market for DHM&S spans diverse industry sectors and solves a variety of challenges. Our clients and partners are extending the use of DHM&S far beyond traditional human factors, with potential application to the design and analysis of any product or process involving human interaction.

New, cutting edge capabilities include: predictive dynamic models and analysis specifically developed for dismounted warfighter activities; automated motion capture processing and analysis; predictive models for precision grasping which are now completely integrated and coupled with existing predictive models for whole body posture; and a suite of capabilities which provide OEM's with truly human-centric design tools for occupant packaging.

SantosHuman's products currently include ETOWL®, a military specific system for evaluating dismounted Warfighter performance and the interaction with warfighter equipment and Santos® Pro, a highly feature rich environment suited for the most challenging DHM&S design and analysis requirements. In addition, the Santos® Posture Prediction SDK is currently being beta tested and allows Santos® Predictive Models for Posture to be embedded in any application. Finally, an extensive open architecture and a peer-to-peer inter-process communication system will allow our clients and partners to both build on the Santos® platform and link Santos® to other models.
